

Beskrivelse

Når du skal gjøre kokain om til crack er det svært skadelig for både deg og omgivelsene dine å bruke salmiakk. **Bikarbonat (natron)** har ikke de samme skadevirkningene, og er derfor et mye bedre alternativ. Dette fås kjøpt i alle dagligvarebutikker.

Dette trenger du:

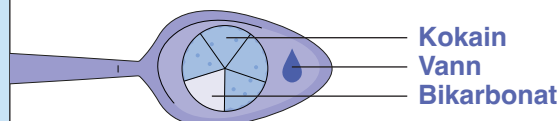

1

Bøy skjeen slik at den kan legges på bordet uten at noe renner ut.

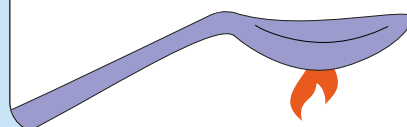

Ta først litt **kokain (fire deler)**, skyv til siden – slik at det er enklere å dosere riktig mengde **bikarbonat (en del)**.

Tilsett deretter litt **vann**.

2

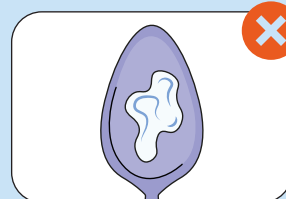

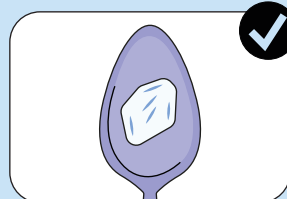

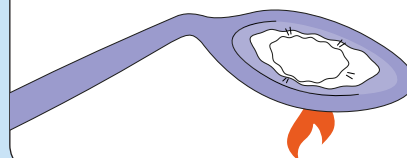

Finn frem lighter, og fordel varmen rundt hele skjeen ved å føre flammen i sirkelbevegelser under skjeen.

3

Kok opp, slik at det dannes en skorpe rundt kokainet som begynner og herdes.

Når kokainet har blitt til en klump og det er en masse i vannet er kokeprosessen ferdig. Tilsett bare mer vann hvis det begynner å tørke.

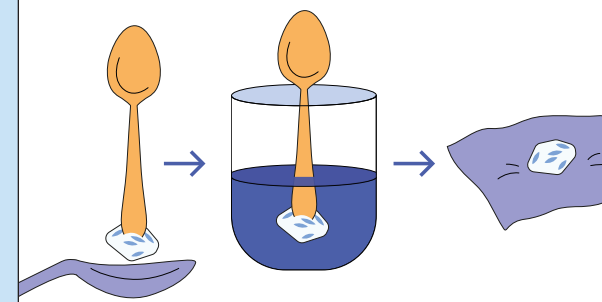

4

Hent kokainet opp av skjeen med en vasket skje eller mynt i rustfritt stål (mynt/skje). Kokainet vil feste seg som en klump.

Skyll deretter denne i et lite glass med vann, for å fjerne smaken av bikarbonat.

Knekk av crack-steinen fra skjeen, og tørk med litt papir.

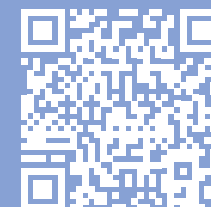

5

Steinen er nå klar til å røykes.

* En pipe er bedre enn aluminiumsfolie

fremgangsmåten:

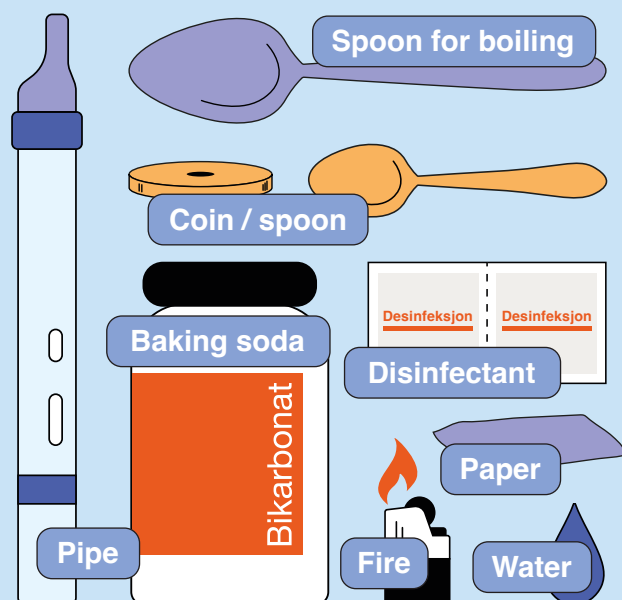

Description

When you convert cocaine into crack, it is very harmful to both you and your surroundings to use ammonia.

Baking soda (bicarbonate) does not have the same harmful effects and is therefore a better alternative. This can be purchased at all grocery stores.

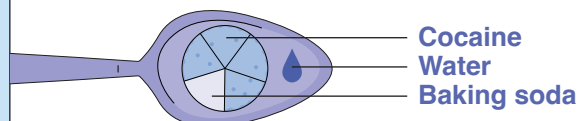

You need:

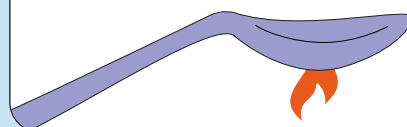

- 1 Bend the spoon so that it can be placed on the table without anything spilling out.

First, take a little **cocaine (four parts)**, push it aside - making it easier to measure the correct amount of **bicarbonate (one part)**.

Then add a little **water**.

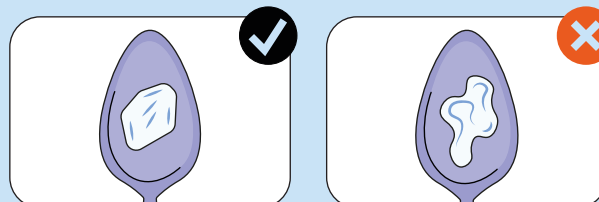

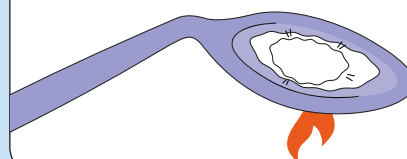

- 2 Use a lighter and distribute the heat around the spoon by moving the flame in circular motions underneath the spoon.

- 3 Boil it up, to form a crust around the cocaine that starts to harden.

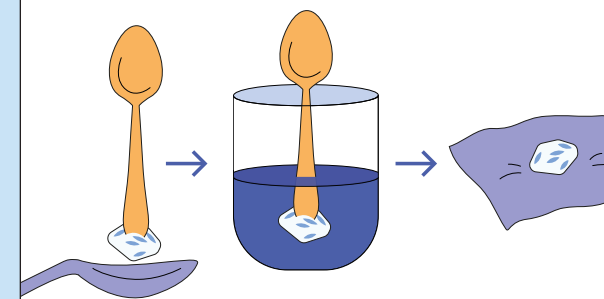

When the cocaine has turned into a lump and there is a mass in the water, the cooking process is finished. You can add more water into the spoon if it begins to dry out.

- 4 Remove the cocaine from the spoon with a clean stainless-steel spoon or coin. The cocaine will clump together.

Dipp it into a small glass of water to remove the taste of bicarbonate.

Break off the crack rock from the spoon and dry it with some paper.

- 5 The rock is now ready to be smoked. Use your pipe.

* A pipe is better than aluminium foil
